INTRODUCTION

While studying the buprestid genus *Taphrocerus* and examining a large number of specimens from various institutions and private collections all over the world, I found a number new distributional records for many species. The genus currently contains 258 valid species and 2 subspecies (Bellamy 2008, Marek 2018b, c, 2019a, b, c, 2020a, b, 2021a, b, c) but many species are only known with insufficient locality data (f.e. „Brasil“) or are known from one locality only, etc. Herein I present new faunal records to country for fifty-two species of *Taphrocerus*, including sixty-six new records to states (provinces, districts, departments or sea islands respective), together with notes about previously „unclear“ or doubtful localities.

MATERIALS AND METHODS

All species/specimens were studied directly, except for *T. depilis* Kerremans, 1896 and *T. havai* Marek, 2016 (data for Guyana only), which have been studied according to the excellent photos (and perfectly suitable for determination of these very „characteristic“ species) from T. Murray's website, and the relevant localities were obtained from him (see below, pers. comm.).

Data from locality labels are cited „verbatim“.

Abbreviations used in the text: the slash mark / is used to indicate data from separate labels; my notations in the text are in parentheses () with the abbreviation (LT) = lectotype, (Obenberger's MS) = Obenberger's manuscript.

Distribution data (“Distribution”) are provided as an alphabetical list of countries with citation of the author and the year of the first presentation for that country or as new for that country. For a country with an area of more than 150 000 km² are given respective states (provinces, districts or departments), the sea islands are listed always.

FAUNISTIC RECORDS

Taphrocerus acaranus Marek, 2018

Material examined: BRAZIL: „Brazil, Santarem, 52°96‘, 1 ♂, (BMNH); „Bahia / Saunders. 74.18‘, 1 ♂, (BMNH); „SOUTH BRAZIL, state Rio de Janeiro, Trindad near Parati, 2.-10. xii. 2000, A. Kudrna jr. lgt.“, 1 ♂, (JMSC).

Distribution. Brazil: Pará (Marek 2018a), new to states Bahia and Rio de Janeiro.

Taphrocerus achardi Obenberger, 1924

Material examined: ARGENTINA: „ARGENTINA, Corr., 12 km. W Ituzaingó, I-23-1989, C & L O'Brien & G. Wibmer / ?“, 1 ♀, (JMSC).

Distribution. Argentina: without exact data (Obenberger 1924), new to province Corrientes.

Taphrocerus aeneocollis Fisher, 1925

Material examined: TRINIDAD and TOBAGO: „TRINIDAD W. I., Chaguaramas, 22. 11. 2005, M. T., leg. C. J. Zwakhals, 10°43'13" N / 61°36'47" W, 7 ♂♂, 5 ♀♀, (JMSC, MHCB); „Trinidad, B. W. Indies, G. E. Bryant, ii. 1903 / G. Bryant Coll., B. M. 1926-86.“, 2 ♀♀, (BMNH); „Tobago (W. I.), Goldsborough, Lure Estate, 2/12-VIII-2004 M. T., leg. M. J. Sommeljer“, 6 ♂♂, 5 ♀♀, (JMSC, MHCB).

Distribution. Panama* (Obenberger 1937a); Trinidad and Tobago: Trinidad (Fisher 1925), new to island Tobago.

Remarks. *Obenberger gave the occurrence in Panama in his Catalogue (1937), without mentioning the source or the relevant specimen studied. I didn't find any specimen of *T. aeneocollis* in Obenberger's collection deposited in NMPC and the occurrence for Panama needs confirmation. (note: there are two very similar species to *T. aeneocollis*, including colouration and aedeagus - *T. dietzi* Fisher, 1933 (it occurs throughout Central America) and *T. ujhelyii* Apt, 1954 (with occurrence in Colombia, see below).

Taphrocerus albopictus (Kerremans, 1896)

Material examined: BRAZIL: „Sta Catharina Brs. / TYPUS / Taphrocerus nigerrimus m. Type (unpubl. manuscript name) Det. Dr. Obenberger“, 1 ♂, (NMPC).

Distribution. Brazil: without exact data (Kerremans 1896b), new to state Santa Catarina.

Taphrocerus alboplagiatus Kerremans, 1896

Material examined: BRAZIL: „Brazil / Saunders. 74.18. / Taphrocera Reichei Lap. Bras.“, 1 ♀, (BMNH); „Fry Rio Jan. / Fry Coll. 1905-100.“, 1 ♂, 2 ♀♀, (BMNH).

Distribution. Brazil: without exact data (Kerremans 1896a), new to state Rio de Janeiro; „Colombia and America centralis“* (Obenberger 1924, under *T. quadriplagiatus* syn.).

Remarks. *Obenberger get the type locality of *T. quadriplagiatus* „Amérique centrale (Columbia?)“ both in his description and the key in 1924 and in the key in 1934. In fact, there is one „Type“ specimen (LT) in NMPC only, with handwritten (Obenberger's MS) locality label „America c.“ and both „America c.“ and „Columbia?“ are probably mistakes (see also Marek 2020a: 178).

Taphrocerus aureopilosus Obenberger, 1934

Material examined: BRAZIL: „Brasilia, Paraná, Vila Velha, 4. iv. 1981, leg. G. Scherer“ (p), 1 ♂, (ZSMC); „SAO PAULO BRS: MRÁZ LEG. MUS. PRAGENSE“, 1 ♀, (NMPC). For another specimens examined see Marek 2018a.

Brazil: Bahia (Marek 2019a), Pará (Marek 2014), new to states Amazonas, Maranhão, Mato Grosso and Pernambuco; Colombia (Marek 2014, without exact data), new to department Choco; Costa Rica (Cobos 1967 under *T. subpolitus* syn.); Ecuador: Napo (Marek 2014); French Guiana (Obenberger 1934); Honduras (Westcott & Hespenheide 2006); Mexico: Chiapas (Westcott & al. 1989), Tabasco (Westcott & Hespenheide 2006), Veracruz (Westcott & Hespenheide 2006); Nicaragua (Maes & al. 1993); Panama (Marek 2014); Suriname: Paramaribo (Marek 2017a); Trinidad and Tobago: Trinidad (Marek 2017a); Venezuela: without exact data (Obenberger 1941 under *T. erbeni* syn.), Apure (Marek 2014), Aragua (Marek 2014); new to Belize.

Remarks. The species with the largest known distribution to date. Although the species belongs to very difficult species-group for determination, it has very „characteristic“ male genitalia (see f.e. Marek 2017b: 386). I only know other three species with similar aedeagi (*T. nanulus* Obenberger, 1934, *T. purpureus* Marek, 2017 and one undescribed species), so determination of male-specimens is without any problems relatively.

Material examined: BRAZIL: „Amazons.“, 1 ♂, (JMSC). TRINIDAD and TOBAGO: „Trinidad, B. W. Indies, G. E. Bryant, ii. 1903 / G. Bryant Coll., B. M. 1926-86.“, 3 ♂♂, 2 ♀♀, 11 spec. sex not examined, (BMNH); „Tobago (WI) Goldsborough, Lure Estate, 2/12-viii-2004 M. T., leg. M. J. Sommeljer“, 2 ♂♂, 3 ♀♀, (JMSC, MHCB).

Distribution. French Guiana (Obenberger 1937a*); Trinidad and Tobago: Trinidad (Fisher 1925), new to island Tobago; new to Brazil: Amazonas.

Remarks. *Obenberger gave the occurrence in French Guiana in his Catalogue (1937), without mentioning the source or the relevant specimen studied. I didn't find any specimen of *T. subglaber* in Obenberger's collection deposited in NMPC and the occurrence for French Guiana needs confirmation. (note: there is very similar and probably closely related species in French Guiana (including aedeagus) - *T. scutellatus* Obenberger, 1934).
